

1. How your project will benefit from React

- What are the main differences between Bootstrap and React?
 - Bootstrap needs to be coded individually across pages, whereas React pages are built as single page applications with components drawn from pre-written Javascript libraries. This should streamline the process of adding components and make the page itself faster to create and load.
- What will React allow you to do that would have been difficult with Bootstrap?
 - React should allow for faster implementation of pre-written components, and the skeletons for common components like information cards, login/sign-up fields will hopefully be easier to find and work with.

2. Expected List of React Components

- Information cards for guests, a better functioning schedule, request page, and a newsletter sign-up section is still desired.
- The information cards for the guests will need to be more streamlined, and the schedule/newsletter aspects of the page didn't really get created in the Bootstrap version of the page.

3. Team responsibilities

- This page will be continuing as a solo project.
